ABSTRACT

This publication contains data on and descriptive analyses of the characteristics of persons registered and voting in the November 1974 Congressional election. Data on socioeconomic characteristics such as age, race, Spanish origin, sex, marital status, education, major occupation, and mobility status are presented in 27 tables. The voter turnout of about 39% was the lowest in an off-year election since 1946. The "hard core" nonparticipants, that is, those who seldom or never vote, are examined in terms of their demographic profiles and their reported reasons for not voting. In addition, the demographic characteristics associated with the low turnout in this election are compared with data from the 1970 Congressional and 1972 Presidential elections. New findings on the effect of length of residence and mobility on voting and registration are analyzed. Finally, analysis is made of the "youth vote," those persons at the lower end of the age scale who have comprised a larger proportion of potential voters since the minimum voting age was uniformly lowered to age 18 by the 26th Amendment. VOTING AND REGISTRATION IN THE ELECTION OF NOVEMBER 1974

The voter turnout in the 1974 Congressional election of about 39 percent, according to official statistics, was the lowest in an off-year election since 1946. This low turnout is reflected in the results of the November 1974 Current Population Survey where 45 percent of all civilians age 18 and older, not residing in institutions, were reported as having cast ballots.¹ Voter participation in 1974 as reported by the survey was about 10 percentage points lower than in the previous Congressional election in 1970, and around 18 percentage points below the level attained in the 1972 Presidential election. That election had one of the lowest turnouts for a Presidential election in recent American history. The number of persons reported as being registered to vote but failing to cast ballots amounted to about 18 percent of the total electorate, while 32 percent were not registered to vote.²

This report presents selected findings from the 1974 voting survey. The "hard core" nonparticipants, that is, those who never vote or seldom vote, are examined in terms of their demographic profile and their reported reasons for not voting. In addition, the demographic characteristics associated with the low turnout in this election are compared with data from the 1970 Congressional and 1972 Presidential elections. New findings on the effect of length of residence and mobility on voting and registration are analyzed. Finally, an analysis is made of the "youth vote," those persons at the lower end of the age scale, who have comprised a larger proportion of potential voters since the minimum voting age was uniformly lowered to 18 by the 26th Amendment.

Despite the unusually low level of participation in the 1974 election, the demographic characteristics that have usually been associated with registration and voting, as reported both in earlier surveys in this series as well as by independent studies, remained generally consistent in their relative rankings in 1974, even though their

absolute levels declined.³ High and low percentages of registration and voting were found among the following groups:

High voting and registration

Persons 45 to 74 years old
Residence outside the South
College graduates
Annual income of \$25,000 and above
Professional and technical workers

Low voting and registration

Persons 18 to 24 years old
Residence in the South
Less than 8 years of school
Annual income under \$5,000
Laborers

In addition to these characteristics, men were more likely to vote than were women, although women were slightly less likely to be registered; and blacks were less likely to vote and register than whites.

Nonvoting. Nonvoting has been a significant feature of recent American political history. Nonvoters comprised about 55 percent of the population of voting age in 1974 and 37 percent in the Presidential election of 1972 (see table A). Cumbersome registration procedures have often been cited as discouraging many potential voters from participating in elections. In recent years registration hours have been lengthened, more registration places have been provided, registration by mail is permitted in a few areas, and laws have been enacted prohibiting outright discrimination against minorities.⁴ Despite these measures, the level of registration in 1974 was below that in 1970, the last Congressional election.

It is evident that a larger proportion of people fail to register to vote than fail to vote once registered. In the 1974 election, for example, about 65 percent of citizens who had satisfied residency requirements were registered, but about 72 percent of all registered persons

¹ The disparity between official results and estimates from the survey has been noted in other surveys, and is due in part to differences between the sample universe and the electorate, and also to certain aspects of the survey process, such as a tendency among respondents to overreport voting participation to interviewers. See Evaluation of the Accuracy of the Data on p. 8 of this report.

² In addition, registration of approximately 6 percent of the electorate was not reported or not known to the person responding for other household members. In most of the tables in this report, this group is included in the total of those not registered.

³ However, the registration rate of persons 18 to 24 years old did not decline between 1970 and 1974.

¹In 1970, 18- to 20-year-olds were eligible to vote only in Georgia and Kentucky; 19- and 20-year-olds in Alaska; and 20-year-olds in Hawaii.

went to the polls on election day.⁵ Further insight into this matter can be found in the reasons people offer as to why they did not vote even though they were registered, and why they were not registered. About 45 percent of the registered nonvoters were reported as staying away from the polls for reasons that were essentially beyond their control, such as illness or physical disability, or because they could not take time off from work, or were out of town. Another 31 percent could be classed as apathetic about politics or the particular election, including those who indicated lack of interest, a general dislike of politics, no preference among the candidates, or a belief that their vote would not matter. The remainder (24 percent) gave miscellaneous reasons or failed to report. The distribution of reasons was substantially the same as in 1972 when the number of registered nonvoters was half as large (that is, no category of reasons changed by more than 5 percentage points). Reasons for not voting in 1974 are shown in table 10. For comparable data for the 1972 election, see P-20, No. 275.

The number of persons who were not registered was about twice as large as the number who were registered but did not vote. About 9 percent of those not registered were not citizens and therefore unable to register

even if they wanted to (see table 12). Another 15 percent cited reasons associated with a recent move as their reason for not registering. Barriers to registration (in addition to those that may have been included in a recent move) were reported in 8 percent of the cases (physical disability, no transportation to a registration site, or inconvenient hours or location of the registration place). The largest share of the nonregistrants (about 51 percent) gave reasons that reflected apathy or cynicism regarding politics. About 12 percent gave miscellaneous reasons and about 6 percent were not reported.

A further perspective on the large portion of the eligible population who did not vote in 1974 was obtained by inquiring whether these individuals had ever voted in a National, State, or local election and, if so, when was the last time (see table 24). About 57 percent of the citizens not registered in 1974 had never voted. And about 13 percent had not voted since before 1968. Those who had not voted since before 1968 or in four consecutive National elections, will be referred to as "seldom voted" in the following paragraphs. The remainder of the 1974 nonvoters, most of whom voted in 1972, will be referred to as "occasional voters."

The composition of nonvoters and seldom voters contrasts with the total eligible population as can be seen in table B. With respect to age, the seldom voters were older than average, with about 74 percent 45 years of age or over as compared with 45 percent of all persons. As would be expected, those who had never voted were predominantly young; about half were between 18 and 24 years of age and about three-quarters

⁵In other words, about 45 million of the eligible voting population were reported as not being registered to vote, including 4 million who were not citizens and 2 million who did not meet residency requirements; whereas 25 million were reported as registered but failed to vote. "Eligible" as used in the remainder of this report refers to those persons of voting age on election day, that is, 18 years old and over in 1974.

were under 35.⁶ Persons who seldom vote were also disproportionately of lower educational attainment than all persons; 40 percent had completed only elementary school as compared with about 17 percent for all persons. A relatively high proportion of those who were reported as never having voted had completed high school grades 1 through 4, but a relatively low proportion had completed 1 or more years of college (see table B).

As would be expected, only a small proportion of those who had never voted and those who seldom voted (that is, "occasional voters") were registered to vote in 1974 (see table B). Barriers associated with recent moves, including not meeting the residence requirements and not registering following a recent move, bulked largest with the occasional voters; 36 percent cited this as the main reason they were not registered compared with about 8 percent of the never voted and

7 percent of the seldom voted (see table C). Other hindrances especially physical disability, were more important to the seldom voted than to the others. Lack of interest was given as a reason for not registering by one-half of those who had never voted, as contrasted with 41 percent of those who had not voted since before 1968 and 28 percent for occasional voters.

In summary, nonvoters in 1974 were made up of groups that contrasted sharply with each other in demographic characteristics and in the reasons they gave for not voting in the Congressional election. Some were persons who generally vote, but were prevented from doing so in 1974 by unavoidable circumstances; others made up a group who vote in Presidential years, but are not sufficiently motivated to vote in a Congressional election. Persons who had not voted in recent years were older than the average, possibly gradually withdrawing from political activity, in some cases because of the infirmities of advancing age. Those who never voted, on the other hand, were younger than the average and perhaps can be expected gradually to involve themselves in voting to reach levels of participation at least comparable with those attained by those currently in their 40's and 50's. Among persons in the age

⁶ For purposes of this discussion, noncitizens have been excluded from the never voted group.

groups most likely to vote, 35 to 64 years old, approximately 10 percent reported that they had never voted in a public election in the United States.

Comparison with the 1970 and 1972 elections. The 1974 election was a low turnout election when compared with the Congressional elections of 1970 and 1966 (see table A, P-20, No. 275). Levels of reported voting in 1974 were about 10 and 11 percentage points, respectively, below those in the earlier elections, and the proportion of eligible voters who reported that they were registered declined by somewhat smaller margins (see table A).

The turnout of voters in nonpresidential elections has always been lower than in years when a President was being selected. In 1974, the reported decline from 1972 voting levels amounted to 18 percentage points while registration was down 10 percentage points.

Although declines in voting and registration were the general rule when 1974 is compared with either of the two previous elections, these declines are not uniform for all age groups and educational levels. In fact, there was one notable exception to the trend: persons 21 to 24 years of age reported a registration rate for 1974 that was about 5 points higher than it had been 4 years

previously. Otherwise declines in voting and registration between 1974 and the two previous elections (1970 and 1972) were lower for persons 55 and over than for persons below that age.

Comparisons of 1974 registration and voting rates with 1970 and 1972 by educational level reveal contrasting patterns (see table D). The reported registration rates of persons with 1 or more years of college declined less than for persons with less education between the 2 Congressional elections; but this same group reported a greater than average decline between 1972 and 1974. As far as voting turnout is concerned, the greatest percentage point decline between 1970 and 1974 occurred among those who completed 4 years of high school only compared with those who did not complete high school and those who attended college. Between 1972 and 1974 the rate of decline in voting participation was greatest among those with some college education.

Despite the large swings in overall participation in American elections, voters in one election are more likely to vote in the next election and nonvoters are likely to continue to be nonvoters. Persons in the 1974 survey who were 20 years old and over were asked whether they had voted in the 1972 Presidential election (see table 15). About 67 percent of those who said they

Table C. Reported Reasons for Not Registering by Year Last Voted for Citizens of Voting Age

¹Includes persons not reporting year last voted.

²Includes persons reporting they had not changed registration, didn't know candidates, religious reason, forgot, and other miscellaneous reasons.

voted in 1972 also reported voting in 1974, and about 91 percent of those who were nonvoters in 1972 reported they did not vote in 1974.⁷ Overall, 69 percent of the eligible electorate exhibited consistent voting behavior, either by voting in both elections (43 percent) or by voting in neither election (26 percent); whereas, about 75 percent were consistent in the 1968 and 1970 elections.

Duration of residence and mobility. Questions on duration of residence and mobility were added to the survey for the first time in 1974. Answers to these questions provide information on the effect on voting and registration of length of time lived in the community, and the effect of a change in residence from differing distances (whether within the same county, between counties, in the same State, or between States).

The less time a person lived at his current address, the less likely he was to have become registered (or maintained a previous registration), and once registered, the less likely he was to have voted in 1974.⁸ Of all persons who had moved within the previous year (amounting to about 17 percent of the total), only about 38 percent

were registered (see table E). The likelihood of being registered increased to about 80 percent for those with 10 or more years at their current address. Living in a community for 1 year or more not only increases the proportion of persons who registered, but also the proportion voting of those registered. About 75 percent of registered persons who had lived at their current residence 6 years or more voted as compared with about 60 percent for those with less than a year's residence at their current address. The greater effort presumably needed to register at a new address did not lead those who made that effort to vote in greater proportions than long established residents who would more likely be registered. Some of the recent movers may have voted at their previous residence. However, only 5 percent of recent movers who voted, voted by absentee ballot. This fact suggests that most of those who moved within the last year, and were registered to vote, had registered at their new address.

Length of residence made substantial differences in voting and registration within each age group (see table E). Among 18 to 24 year olds, about 33 percent of those with less than 1 year at their current residence were registered, compared with 55 percent of the youth who had lived at the same address for at least 10 years. The highest proportion registered was among persons 45 to 64 years old with 10 years' length of residence; approximately 86 percent of them were registered. About 46 percent of these older persons who had moved within the year were registered to vote. As duration of residence increased, black political participation was lower relative to that for all persons. Thus, blacks who lived at the same address for 6 years or more were less likely to register and vote than were all persons.

Another dimension related to changing one's residence is the effect that moving across county or State lines has on registration and voting. This effect was

⁷ Asking a retrospective question about voting behavior two years previously, even for an event as salient as a Presidential election, introduces memory biases into the data. However, a comparison of 1972 voting from the 1972 report with reported 1972 voting in 1974 reveals an increase of only 0.8 of a percentage point for the more recent report. See the section on Evaluation for more discussion of this matter.

⁸ However, there is no statistically significant difference in the voting rates among registered persons who lived at the same address for 6-9 years compared with those residing 10 years or more at the same address shown in table E.

Table D. Reported Voting and Registering by Years of School Completed: 1970 to 1974

(Persons of voting age. Civilian noninstitutional population)

Years of school completed	Percent registered			Percent voted

Source: Table 20.

measured for three duration of residence categories: those who had lived at their current address for less than 1 year, for 1 to 2 years, and for 3 to 5 years. Those with the longest residence exhibited almost no difference in registration and voting behavior, whether they last moved within the same county, moved to another county in the same State, or moved to a different State. More recent movers were less likely to be registered and, to some extent, to have voted, if they moved to another county and especially so if they crossed State lines, than if they remained in the same county. The reduction of residence requirements to a maximum of 30 days makes mobility less of a barrier in Presidential elections.

The effect of a highly mobile society, both in terms of length of residence and in distance of move, had a definite impact on voting and registration in 1974. Recent moves and moves across State lines have been shown to depress registration and voter participation at all ages. In addition, persons with higher educational levels were much more likely to register and vote, even those that had recently moved, than were persons with little education. However, with increasing age (up to the point where general voting participation declines among the elderly) and at higher educational levels, mobility became less of an obstacle.

Youth. Before 1972 when persons under 21 years old were not eligible to vote in National elections (except in 4 States), surveys of political participation indicated a low voting rate among all young persons under 25 years old. In States which allowed 18 to 20 year olds to vote, approximately one-fourth actually reported voting (see P-20, No. 228). About one-half of the newly enfranchised 18 to 20 year olds reported voting in the 1972 Presidential election; but in the 1974 Congressional election, only 21 percent of 18 to 20 year olds did so. Youth (persons 18 to 20 years old) constituted a small portion of the electorate, 8 percent of persons of voting age, 12 percent of nonvoters and 4 percent of voters. Although the turnout of 18 to 24 year olds was lower than in 1972, the voting rate of this age group did not by itself account for the low turnout in the 1974 Congressional election.

Some writers have predicted that the higher educational levels of young persons now 18 to 24 years old may lead to higher levels of political participation in the future.⁹ It has been suggested that young people do not

vote because they are too geographically mobile to become acquainted with persons running for local offices and that they are less likely to have the family and work responsibilities which increase the feeling that one's vote is necessary. The data shown in tables 4, 5, and 20 indicate the extent to which young persons are more likely to move, are less likely to be married, and more likely to have some college education. The proportion of married young people who voted is lower than for young single persons. Data from the 1972 voting survey showed that those young adults in school or college were more likely to vote than those not enrolled.¹⁰

Table F shows the proportion of persons registered to vote by educational level and age. The level of education is strongly related to the probability of being registered to vote for persons at all ages (see cover chart). Registration rates were especially low among young persons without a high school education; but a high educational level does not insure that youth will vote at the same rate as older adults; voting rates were lower for 18 to 24 year olds than for older persons at every educational level.

Source: Table 5.

The low participation rates of youth in the 1974 Congressional election was largely due to their failure to become registered to vote. Only about 41 percent of those under 25 reported that they were registered. But of those registered, 58 percent reported voting.

Although a much higher proportion of younger persons were not registered to vote than were older adults, the reasons given for not registering were surprisingly similar for the two groups (see table 12). However, some differences did exist. For example, a higher proportion of persons 18 to 24 years old than older persons who had not registered indicated that they were "not interested" in registering. On the other hand, persons under 25 years of age were less apt than older persons to cite physical disability as a reason for not being registered and they were less inclined to give reasons that suggested negative attitudes toward politics (such as did not like politics in general, did not prefer any of the candidates, or vote wouldn't matter anyway).

There is no indication from the tables on reasons for not voting of those who were registered that youth were more "alienated" from the voting process than older persons. Registered youth were more likely to have been reported as away from home on election day; and they were less likely to say they were "unable to go to the polls" or to say they "disliked politics" than were older persons.

Evaluation of the accuracy of the data. In the November 1974 Current Population Survey supplement on voting, 63.2 million of the 141.3 million persons in the civilian noninstitutional population were reported (by themselves or by members of their households) as having voted in the 1974 Congressional election. The official count shows 56 million votes were cast. The survey estimate is 5 percentage points higher than the official count. The "official count" was obtained by summing the number of votes cast for either Senator, Congressman, or Governor in each State, depending on which office received the highest number of votes.¹¹

The five previous surveys of voting conducted by the Bureau of the Census, beginning in 1964, also resulted

in higher estimates than the official count of votes cast. The reports of those surveys, Series P-20, Nos. 143, 174, 192, 228, and 253, contain analyses of possible reasons for this difference. Much of the discussion in those reports is applicable here.

In summary, several general reasons were advanced to account for the different estimates of the number of voters. There appears to be a tendency for persons to overreport their voter participation because of a reluctance to admit, either to an interviewer or in front of other family members, a dereliction in civic responsibility. Associated with this reason is an apparent tendency for the respondent to give another member of the household the benefit of the doubt and report that the person had voted when there was uncertainty about it. This problem may be especially relevant to reported voting of 18 to 20 year olds inasmuch as only about 33 percent of these respondents reported for themselves, since many were away at college and were reported for by their parents. Another factor is the Current Population Survey estimation procedure which attributes the characteristics of interviewed persons to persons in similar households where no interview was obtained. The coverage of the CPS sample and the independent population estimates to which the survey results were adjusted are known to underrepresent certain groups where nonvoting was found to be high. Finally, the total number of persons reporting that they cast votes could be expected to be higher than the official count because some ballots are invalidated or because some persons voted only for candidates at the city or county level, although precise estimates of the magnitude of these sources of error are not available.

A portion of the difference between the official count and the survey results may be attributable to the use of a household respondent to report on the registration and voting behavior of all eligible household members. An experiment was conducted in conjunction with the November 1974 CPS to assess the effects of this procedure. In approximately one-eighth of the sample households, interviewers were instructed to obtain the voting supplement information from each individual directly insofar as possible and within the time constraints imposed by the collection of the monthly labor force data, which is the primary purpose of the Current Population Survey. For the entire sample, 57 percent of all interviewed persons reported for themselves, as compared with about 76 percent for the test group. (The results of the test group interviewing were incorporated

¹¹ Actual votes cast are reported in "Official 1974 Returns For Congress, Governors." *Congressional Quarterly* (April 5, 1975), pp. 716-23.

into the totals for the survey.) A comparison of the proportion of persons reported as registered and voting

for the test group, for persons reporting for themselves, and by a proxy is shown in the table below.¹²

Percent Registered and Voted as Reported in the Full CPS Sample and by Persons Reporting for Themselves

Percent registered and voting	Total	Full sample		Test group
		Reported by self	Reported by other (proxy)	
Percent registered.....	66.1	66.1	66.2	66.2
Percent voted.....	47.2	46.9	47.7	46.9

The differences between groups reporting for themselves or someone else are not significant. Thus, obtaining voting and registration information from a proxy rather than from the individual himself evidently does not account for the overestimate of voters obtained in household surveys.

A person's reasons as to why he or she did not vote or was not registered might be considered more susceptible to variation when these reasons are supplied by another household member, as they were in about 40 percent of the cases. However, an examination of the reasons obtained in the test group as compared with those from the full sample reveals that in all but one instance the estimated difference between the two sets of reasons is less than 2 percentage points. The proportion reported as "don't know" and "not reported" on reason for not voting was about 3 percentage points lower in the test group than in the full sample.

Failure to remember is not considered to be a problem in the voting survey, since the data in each survey were collected during the week containing the 19th day of November, which was generally about 2 weeks after the election. However, in the 1974 and 1970 surveys, questions were also asked about whether respondents had voted in the previous Presidential election. Asking retrospective questions of this kind introduced possible memory biases into the data, and the net effect would be expected to be a further overstatement of voter participation. That effect is fairly small with regard to the 1968 and 1972 Presidential elections as table G shows.

The increase of 0.8 percent in the proportion voting in the 1972 election as reported in 1974 is smaller than the difference reported in the 1968 and 1970 surveys. Factors other than recall which may affect the voting rates are changes in the universe due to the combined effect of sampling difference, deaths, movement into

and out of the Armed Forces, and international migration. Persons with less than a high school education reported a higher level of voting in 1972 when asked retrospectively about it in 1974 than they did in 1972. These persons also reported a below average decline in voting in 1974 as compared with 1972. Persons with high school diplomas and beyond reported lower levels of 1972 voting in the 1974 survey than they did in 1972. These persons had greater than average declines in voting between the Presidential and Congressional elections.

In 1974, nonvoters were asked, for the first time, to recall whether they had ever voted. If there is some tendency for persons to be reluctant to report that they had not voted in a specific election, there must be even more reluctance to report that one has never voted, except where the reason poses no threat to an individual's sense of responsibility as a citizen, including persons who were citizens of another country. It is therefore believed that the number of persons who are reported as having never voted can be considered as a minimum estimate.

Estimates of voter participation that are higher than the official counts have been the common experience of other survey organizations which have studied voting behavior. Explanations similar to those cited in this report have been given by these groups to account for the discrepancies.¹³

¹²To make the comparisons as nearly equivalent as possible, those who were reported as "don't know" or "not reported" on voting have been eliminated from these calculations.

¹³For a comprehensive discussion of this problem, including a comparison of the 1964 Bureau of the Census survey with that conducted by the Survey Research Center of the University of Michigan, see Aage R. Clausen, "Response Validity: Vote Report," *Public Opinion Quarterly*, Vol. XXXII, No. 4, Winter 1968-69, pp. 588-606.

RELATED REPORTS

Current population reports. Advance data on reported voter participation and registration of the population of voting age, by race and sex, for the United States and regions in the November 1974 election are contained in the report Series P-20, No. 275.

Data on voter participation by social and economic characteristics of the population of voting age in the 1964, 1968, and 1972 Presidential elections and in the 1966, 1970, and 1974 Congressional elections were published in the reports Series P-20, Nos. 143, 192, 253, 174, and 228, respectively.

Data on the social and economic characteristics of persons 18 to 24 years old who became eligible to vote

on the basis of age in 1972 were published in Current Population Reports, Series P-20, No. 230.

Projections of the population of voting age for the United States, regions, divisions, and States for November 1, 1974 were published in Current Population Reports, Series P-25, No. 526.

Data on the social and economic Characteristics by reported voter participation of the population of voting age in the 1966 and 1964 elections and estimates of the population of voting age for the United States, regions, divisions, and States, as of November 1, 1968, were published in a composite report Series P-20, No. 172.

The number of persons of voting age in 1960 and the votes cast for President in the elections of 1964 and 1960 for the United States, by States and counties, are contained in the report Series P-23, No. 14.

APPENDIX A

DEFINITIONS AND EXPLANATIONS

Population coverage. The data in this report were collected in conjunction with the November 1974 sample survey which covered the population of the 50 States and the District of Columbia. The figures shown relate to the civilian noninstitutional population.

Geographic regions. The four major regions of the United States, for which data are presented in this report, represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

North Central: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West: Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming, Alaska, and Hawaii.

The North as used in this report includes the combined Northeast and North Central regions.

Geographic divisions. The two major geographic divisions for which data are shown in this report represent groups of States as follows:

Mountain: Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, and Nevada.

Pacific: Washington, Oregon, California, Alaska, Hawaii.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas constitutes the metropolitan population. Except in New England a standard metropolitan statistical area is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in a standard metropolitan statistical area if according to certain criteria they are essentially metropolitan in character and socially and economically integrated with the central city. In New England, standard metropolitan statistical areas have been defined on a town rather than county basis. Standard metropolitan statistical areas of

this report are identical with the standard metropolitan statistical areas of the 1970 census and do not include any subsequent additions or other changes.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the November 1972 survey and in the Current Population Surveys since March 1960 is the same as that used in the 1960 census but differs from that used in earlier censuses.

According to the current definition, the farm population consists of all persons living in rural territory on places of less than 10 acres yielding agricultural products which sold for \$250 or more in the previous year, or on places of 10 acres or more yielding agricultural products which sold for \$50 or more in the previous year. Rural persons in institutions, motels and tourist camps and those living on rented places where no land is used for farming are not classified as farm population.

The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Reported voter participation. Voter participation data for 1974 were derived from replies to the following question asked of all persons of voting age: "This month we have some questions about whether people voted in the November 5th Congressional election. Did (this person) vote in the election held on November 5th?"

Those of voting age were classified as "voted" or "did not vote." In most tables, "did not vote" class includes those reported as "did not vote," "do not know if voted," and nonrespondents, but there are exceptions, which are properly noted in the tables where the "did not vote" class includes only those reported as "did not vote." Nonrespondents and persons who reported that they did not know if they voted were included in the "did not vote" class because of the general over-reporting by respondents in the sample.

Data shown in this report on voting for President in 1972 were derived from questions asked in 1974. The question referring to 1972 was as follows: "Thinking back to 1972 did (this person) vote in the Presidential election that year?"

Reason not voted. Data on reported reason for not voting were collected in the Current Population Survey by asking the following question of those persons who reported that they were registered but did not vote: "What was the main reason (this person) did not vote in the election of November 5th?"

The answer was recorded in one of the following categories:

COULD NOT VOTE

Had no way to get to the polls
 Couldn't take time off from work
 The lines were too long, machines not working
 Was sick that day
 Sickness or emergency in family
 Have a permanent physical disability
 Didn't know an election was to be held
 Was away from home

DID NOT WANT TO VOTE

Dislikes politics in general
 Did not prefer any of the candidates
 Vote wouldn't matter anyway
 Not interested, just didn't get around to it
 Other reason
 Don't know

Whether voted in person. Persons who reported that they voted were asked, "Did (this person) vote in person or by absentee ballot?" Responses were recorded as "In person," "Absentee ballot," or "Don't know."

Time of day voted. Data on time of day voted was obtained in the November 1974 Current Population Survey from replies to the direct question: "At what time of day did (this person) vote?" The answer was recorded in one of the following categories:

Before 8 a.m.
 8 a.m. to noon
 Noon to 4 p.m.
 4 p.m. to 6 p.m.
 After 6 p.m.
 Don't know

Reported registration. The data shown on registration were obtained by tabulating replies to the following question for those persons included in the category "did not vote." "Was (this person) registered to vote in the November 5th election?"

All persons reported as having voted were assumed to have been registered. Therefore, the total registered population is obtained by combining the number of persons who voted and persons included in the category "did not vote," but who had registered.

Persons eligible to register. The population of voting age includes a considerable number of persons who meet the age requirement but cannot register and vote. Only citizens are eligible to vote. Among citizens of voting age, some persons are not permitted to vote because they have been committed to penal institutions, mental hospitals, or other institutions, or because they fail to meet State and local resident requirements for various reasons. The eligibility to register is governed by State laws which differ in many respects.

Registration is the act of qualifying to vote by formally enrolling on a list of voters. With certain exceptions, such as for members of the Armed Forces, registration must be done in person. For the majority of States, registration is permanent, that is, once a person has enrolled as a voter his name remains on the list as long as he continues to vote in the same jurisdiction—usually at least once every two or four years. In a few States or parts of States voters must register for each election in which they desire to vote. People who have moved to another election district must take steps to have their names placed on the voting rolls in their new place of residence.

In a few States or parts of States, no formal registration is required. Voters merely present themselves at the polling place on election day with proof that they are of age and have met the appropriate residence requirements. Therefore, in these areas persons who are citizens and of voting age, and who meet the residence requirements would be considered as being registered.

Reasons not registered. Data on reported reason for not registering to vote were collected in the Current Population Survey by asking the following question of those persons who reported that they had not registered to vote: "What was the main reason (this person) was not registered to vote?"

The answer was recorded in one of the following categories:

COULD NOT REGISTER

Not a United States citizen
 Had not lived here long enough to be qualified to vote
 Recently moved here, haven't got around to registering
 Permanent disability or illness
 No transportation
 Hours of place of registration inconvenient
 Didn't know how or where to register

DID NOT WANT TO REGISTER

Dislikes politics in general
 Did not prefer any of the candidates
 Vote wouldn't matter anyway
 Not interested, just didn't get around to it
 Other reason
 Don't know

Duration of residence and mobility. Data on duration of residence were obtained from replies to the following question: "How long has (this person) lived at this address?"

Persons who reported having lived at their current address for less than 6 years were also asked, "Where did (this person) live before (this person) moved to this

address?" The answer was recorded in one of the following categories:

- Same county
- Different county, same State
- Different State
- Outside U.S.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: white, Negro, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and Negro. The terms Negro and black are used interchangeably.

Spanish origin. Persons of Spanish origin were persons who reported themselves as Mexican-American, Chicano, Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Spanish origin. Persons of Spanish origin may be of any race.

Household. A household includes all of the persons who occupy a house, an apartment, or other group of rooms, or a room which constitutes a housing unit under the 1970 census rules. A group of rooms or a single room is regarded as a housing unit when it is occupied as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure, and when there is either (1) direct access from the outside or through a common hall, or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

Head. One person in each household is designated as the "head." The head is usually the person regarded as the head by the members of the group.

Family. The term "family," as used here, refers to a group of two persons or more related by blood, marriage, or adoption, and residing together; all such persons are considered as members of one family.

Head of family. One person in each family residing together was designated as the head. The head of a family is usually the person regarded as the head by members of the family. Women are not classified as heads if their husbands are resident members of the family at the time of the survey.

Primary family. The term "primary family" refers to the head of a household and all other persons in the household related to the head by blood, marriage, or adoption.

Marital status. The marital status classification identifies four major categories: Single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting in a hospital, etc., at the time of the enumeration. Persons reported as "separated" included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Level of school. The statistics on level of school indicate the number of persons enrolled at each of two levels: high school or below and college. The latter group includes students enrolled in the first or higher year in a college or university, including graduate students.

Full-time and part-time attendance. College students were classified in this report according to whether they were attending school on a full-time or part-time basis. A student was regarded as attending college full time if he was taking 12 or more hours of classes during the average school week, and part time if he was taking less than 12 hours of classes during the average school week.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to two questions: (a) "What is the highest grade of school he has ever attended?" and (b) "Did he finish this grade?" The questions on educational attainment apply only to progress in "regular" schools.

Labor force and employment status. The definitions of labor force and employment status in this report relate to the population 14 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not

they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Civilian labor force. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation and class of worker. Data on occupation and class of worker are shown for the employed and relate to the job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The major occupation groups used here are mainly the major groups used in the 1970 Census of Population. The composition of these groups is shown in Volume I, *Characteristics of the Population*, Part 1, *United States Summary*.

The class-of-worker classification specifies "wage and salary workers" and "self-employed workers." Wage and salary workers received wages, salary, commissions, tips, pay in kind, or piece rates from a private employer or from a government unit. Self-employed workers have their own business, profession, or trade, or operate a farm for profit or fees. The self-employed include unpaid family workers.

Family income. Income as defined in this report represents the combined total money income of the family before deductions for personal taxes, Social Security, bonds, etc. It is the algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings received by all family members during the 12 months prior to the November 1972 survey. It should be noted that, although the family income statistics refer to receipts during the previous 12 months, the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to the date of the survey.

The income table includes in the lowest income group (under \$5,000) those who were classified as having no income in the preceding 12 months and those reporting a loss in net income from farm and nonfarm self-employment or in rental income. Many of these were living on income "in kind," savings, or gifts; or were newly constituted families, or families in which the sole breadwinner had recently died or had left the household. However, many of the families who reported no income probably had some money income which was not recorded in the survey.

The income table in this report includes a separate category for families for whom no income information was obtained. In most of the other Current Population Survey reports showing income data, the missing income data have been allocated.

The money income level of families shown in this report may be somewhat understated. Income data from the November control card are based on the respondent's estimate of total family money income for the preceding 12 months coded in broad, fixed income intervals. Income data collected in the March supplement to the Current Population Survey are based on responses to 8 direct questions asked for all persons 14 years old and over identifying 14 different sources of income and cover the preceding calendar year.

Previous research has shown that the use of broad income intervals to record money income tends to reduce the rate of nonreporting while increasing the likelihood that the amounts reporting will be significantly understated as compared with results from more detailed questions.

Rounding. The individual figures in this report are rounded to the nearest thousand. With few exceptions, the individual figures in this report have not been adjusted to group totals which are independently rounded. Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. The estimates in this report are based on data obtained in the Current Population Survey (CPS) in November of each of the years 1974, 1972,

1970, 1968, and 1966. The following table provides a description of some aspects of the Current Population Survey design.

Description of the Current Population Survey

Time of data collection	Number of sample areas	Number of counties ¹	Housing units occupied		Housing units visited, not interviewed ²
			Interviewed	Not interviewed	
Nov. 1974 and Nov. 1972....	461	923	45,000	2,000	8,000
Nov. 1970 and Nov. 1968....	449	863	48,000	2,000	8,500
Nov. 1966.....	357	701	33,500	1,500	6,000

¹These numbers of counties and independent cities provide coverage in each of the 50 States and the District of Columbia.

²These are housing units which were visited, but were found to be vacant or otherwise not to be interviewed.

The estimating procedure used in this survey involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates are based on statistics from the 1970 population; statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces.

Reliability of the estimates. Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedule, instructions, and enumerators. As in any survey work, the results are subject to errors of response and of reporting, as well as being subject to sampling variability. For a discussion of the errors of response and reporting, see the section on "Evaluation of the Accuracy of the Data."

Sampling variability. The reliability of an estimate is described in terms of standard errors which are primarily measures of sampling variability, that is, of the variations that occur by chance because a sample rather than the whole of the population is surveyed. As calculated for this report, the standard error also partially measures the effect of certain response and enumeration errors but does not measure, as such, any systematic biases in the data. The chances are about 63 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are about 90 out of 100 that the difference would be less than 1.6 times the

standard error, and the chances are about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better. Most are significant at a level of more than 2.0 standard errors. Thus, for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

The figures presented in tables A-1 through A-6 are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. In addition, where two or more items have nearly the same standard errors, one table is used to represent them. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item. Standard errors for values within the ranges of the tables may be approximated by interpolation.

Description of which standard error table to use. Tables A-1 through A-3 contain the standard errors of estimated numbers of persons 18 years old or older. Table A-1 contains standard errors for estimates of total or white characteristics. Table A-2 contains standard

errors for items pertaining to Negro and most other races. For estimated numbers of persons of Spanish origin, use table A-1 and multiply the standard errors by 1.7. Table A-3 contains standard errors of estimated numbers for census geographic regions or for residence data (e.g., metro-nonmetro status or length of residence). Tables A-4 through A-6 contain standard errors of estimated percentages by race and region or residence categories for persons 18 years old or older.

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends on both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the table indicated by the numerator. The guidelines used to decide whether tables A-1, A-2, or A-3 are appropriate for a particular item should be used for deciding which of tables A-4 through A-6 is correct.

Table A-7 shows factors to be applied to the appropriate standard errors in tables A-3 and A-6 to estimate standard errors for estimates of voting characteristics in the fifteen largest States and the 30 largest SMSA's. These factors should also be applied, when appropriate, to the standard errors found by using the parameters for Residence of Census Regions in table A-8 as explained in the following sections.

Methods for finding standard errors of estimated numbers and percentages. Tables A-1, A-2, and A-3 show standard errors for estimated numbers. Linear interpolation in these tables may be used to obtain standard errors for intermediate values not shown, or the following formula, (F.1), from which the standard errors were derived, may be used directly to compute the standard error; direct computation will give more accurate results than linear interpolation:

$$\sigma_x = \sqrt{ax^2 + bx} \quad (F.1)$$

In this formula, x is the size of the estimate and a and b are parameters used to calculate standard errors for the particular type of characteristic that x represents. The parameters can be obtained from table A-8. The standard errors displayed in selected tables of the estimates were calculated using formula (F.1).

Tables A-4 through A-6 contain standard errors of estimated percentages. Linear interpolation in these tables may be used to obtain standard errors for intermediate values of x and p , or the following formula, (F.2), from which the standard errors were

derived, may be used directly to compute the standard errors; direct computation will give more accurate results than interpolation:

$$\sigma_{x,p} = \sqrt{\frac{b}{x} \cdot p(100 - p)} \quad (F.2)$$

Here x is the size of the subclass of the population which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table A-8 associated with the particular type of characteristic in the numerator of the percentage.

Note when using small estimates. Percentage distributions are shown in this report only when the base of the percentage is greater than 75,000. Because of the large standard errors involved, there is little chance that percentages would reveal useful information when computed on a smaller base. Estimated totals are shown, however, even though the relative standard errors of these totals are larger than those for the corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

Illustrations of the use of standard error tables. Table 1 of this report shows that 1,852,000 males aged 21 to 24 years reported voting in November 1974. Table A-1 shows the standard error of an estimate of this size to be about 66,000.¹ The chances are about 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 66,000. The chances are about 95 out of 100 that the estimate would have differed from a complete census figure by less than 132,000; i.e., twice the standard error.

Table 1 of this report also shows that these 1,852,000 males aged 21 to 24 years represented 27.2 percent of the 6,800,000 total males aged 21 to 24 years in November 1974. Table A-4 shows the standard error of 27.2 percent on a base of 6,800,000 to be approximately 0.9 percent.² Consequently, chances are about 68 out of 100 that the estimated 27.2 percent would be within 0.9 percentage points of a complete census figure, and chances are about 95 out of 100 that the estimate would be within 1.8 percentage points of a complete census figure; i.e., this 95 percent confidence interval would be from 25.4 to 29.0 percent.

¹ Formula (F.1) also gives a standard error of approximately 66,000.

² Formula (F.2) also gives a standard error of about 0.9 percent.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the square of the standard error of each estimate. This formula will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error. A more precise approximation to the sampling error of the difference in percentages is given below.

Difference between percentages. The formula for the approximate standard error of a difference between estimated percentages is given by (F.3) or (F.4):

$$\sigma_{(p_1 - p_2)} = \sqrt{\sigma_{p_1}^2 + \sigma_{p_2}^2} \quad (F.3)$$

$$= \sqrt{\frac{b_1}{x_1} p_1 (100 - p_1) + \frac{b_2}{x_2} p_2 (100 - p_2)}$$

where the bases, x_1 and x_2 , of the percentages do not overlap, or

$$\sigma_{(p_1 - p_2)} = \sqrt{\frac{b}{x} [100(p_1 + p_2) - (p_1 - p_2)^2]} \quad (F.4)$$

where the base x of the two percentages is the same.

In (F.3), b_1 and b_2 are the parameters found in table A-8 for the characteristics and population in question; p_1 and p_2 are the percentages being compared ($0 \leq p_1, p_2 \leq 100$). In (F.4), b is the b parameter from table A-8 for the characteristic in question. Note in (F.4) that the characteristics corresponding to p_1 and p_2 have the same b parameter.

Formula (F.3) is to be used when the bases do not overlap; for example, reported voter turnout among males 18 to 20 years of age compared with reported voter turnout among males 21 to 24 years of age. It can also be used when one base is a subset of the other; for example, the comparison of reported voter turnout among males to the total reported voter turnout, but in this case (F.3) will overestimate the standard error of the difference.

Formula (F.4) is to be used when the base of the two percentages is the same, the percentages do not overlap, and the characteristics are of the same type; for example, if the base is all persons reported voting and one is comparing the percent of these persons who were males with the percent who were females (table 1), one may use Formula (F.4) to calculate the standard error of the difference.

Illustration of the computation of the standard error of a difference between estimated percentages. Table 1 of this report shows that, of 5,540,000 males aged 18 to 20 years in November 1974, 1,184,000 or 21.4 percent reported voting in November 1974. The apparent difference between the proportion of 18 to 20 year old males who reported voting and 21 to 24 year old males who reported voting is $(27.2 - 21.4) = 5.8$ percent. The standard error of the 27.2 percent reported voter turnout among 21 to 24 year old males is about 0.9 percent, as shown above. Formula (F.2) shows the standard error of an estimated 21.4 percent on a base of 5,540,000 to be about 0.9. The standard error of the estimated difference of 5.8 percent is about

$$1.3 \pm \sqrt{(0.9)^2 + (0.9)^2}$$

Table A-1. Standard Errors of Estimated Numbers of Persons 18 Years Old or Older for 1968, 1970, 1972, and 1974

25,000.....	0.2	0.3	0.4	0.5	0.5	0.6

Note: For CPS Spanish origin percentage estimates, use table A-4.

To estimate standard errors for estimates from the November 1966 CPS, multiply these standard errors by 1.2.

Table A-6. Standard Errors of Estimated Percentages of Persons 18 Years Old or Older for 1968, 1970, 1972, and 1974

Regions or Residence

(68 chances out of 100)

Base of percentage (thousands)	Estimated percentage					
	2 or 98	5 or 95	10 or 90	20 or 80	25 or 75	50
100.....	3.5	5.4	7.4	9.9	10.7	12.4
250.....	2.2	3.4	4.7	6.2	6.8	7.8
500.....	1.6	2.4	3.3	4.4	4.8	5.5
1,000.....	1.1	1.7	2.4	3.1	3.4	3.9
5,000.....	0.5	0.8	1.1	1.4	1.5	1.8
10,000.....	0.3	0.5	0.7	1.0	1.1	1.2
25,000.....	0.2	0.3	0.5	0.6	0.7	0.8
50,000.....	0.2	0.2	0.3	0.4	0.5	0.6
100,000.....	0.1	0.2	0.2	0.3	0.3	0.4

Note: To estimate standard errors for estimates from the November 1966 CPS, multiply these standard errors by 1.2.

This means the chances are about 68 out of 100 that the estimated difference based on the samples would vary from the difference derived using complete census figures by less than 1.3 percentage points. The 68 percent confidence interval around the 5.8 percentage point difference is from 4.5 to 7.1 percent; i.e., 5.8 ± 1.3 . A conclusion that the average estimate of the difference derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95 percent confidence interval is 3.2 to 8.4 percentage points. We can conclude with 95 percent confidence that the reported voter turnout among 21 to 24 year old males was actually larger than among 18 to 20 year old males in November 1974; i.e., the difference is not zero.

Table A-7. Factors to Be Applied to Tables A-3 and A-6 to Approximate Standard Errors Not Tabled

Table A-8. Parameters for Calculating Standard Errors for Voting Characteristics

Characteristic	a	b
TOTAL U.S.		
Total or White.....	-0.000021	2518.4108
Black or Other.....	-0.000289	3686.2837
Residence or Census Regions.....	-0.000052	6242.0803

Note: To estimate standard errors for voting characteristics in the fifteen largest States and 30 largest SMSA's, use these parameters and multiply the resulting standard error by the appropriate factor from table A-7.

Illustration of the use of table of factors (table A-7). Table 2 of this report shows that there were 6,893,000 persons who reported voting in California in November 1974. Table A-3 shows that the standard error of an estimate of this size is about 201,000. Table A-7 shows that the factor for California is 1.3. Thus, the standard error of an estimate of 6,893,000 persons reporting voting in California is about $261,000 = 1.3 \times 201,000$.

Standard errors for other statistical measures. Medians, means, and ratios are examples of other statistical measures commonly used in the analysis of data from sample surveys. These measures have not been applied in the analysis used in this report. Further, none of the detailed tables provide these measures for the users of these data. For these reasons, the methods of calculating standard errors for medians, and ratios have not been included. These methods are available at the Bureau of the Census and may be obtained upon request.

NOVEMBER VOTING SUPPLEMENT QUESTIONNAIRE95
